

<i>Preface</i>	<i>page</i> vii
1 The scope of the problem	1
2 Historical perspective	9
3 Theories on mutualism	14
3.1 Theories on co-operation	14
3.2 The predictions	21
3.3 Models	22
3.3.1 Lotka–Volterra type models; functional response models	24
3.3.2 Life-history models	35
3.3.3 Metapopulation models	43
4 Mutualisms between ants and their partners	57
4.1 Phylogeny and feeding ecology	57
4.2 Associations of ants with nectar/honeydew producing partners	65
4.2.1 Ants	65
4.2.2 Aphids	67
4.2.3 Coccids	69
4.2.4 Membracids	73
4.2.5 Lycaenids	79
4.3 Emerging patterns in the distribution of outcomes	83
4.3.1 Phylogeny	84
4.3.2 Genetics	85
4.3.3 Ecology	85
5 A special case: aphids and ants	89
5.1 Features associated with ant attendance	89
5.2 Cost–benefit perspective	91
5.3 The effects of ants on life-history characteristics and fitness	98
5.4 Specialization and coevolution	100
6 Multitrophic-level interactions	107
6.1 Mutualism within a resource-tracking framework	107
6.1.1 Bottom-up and top-down forces	107
6.1.2 Plant chemical defence	112
6.1.3 Host plant heterogeneity	114
6.2 Population effects	118
6.2.1 Seasonal dynamics and density dependence	118
6.3 Dispersal	123
6.4 Community effects	133
6.5 Metamutualism	143
6.5.1 Experimental evidence for metamutualism	153
6.5.2 Examples of multiple mutualistic interactions	161
6.5.3 Extrafloral nectaries	167
6.5.4 General conclusions	171
7 Prospects and conclusions	175
7.1 Life-history level	176
7.2 Population level	177
7.3 Community level	179
7.4 Ecosystem level	181
7.5 Conclusions	182
<i>References</i>	184
<i>Species index</i>	212
<i>Subject index</i>	215
